1.INTRODUCTION

1.1 Overview

Erythema is the redness of the skin or mucous membranes, caused by hyperaemia in the superficial capillaries. If these diseases are not treated at an early stage, they can cause complications in the body, including the spread of infection from one person to another. The skin diseases can be prevented by investigating the infected region at an early stage. The characteristics of the skin images are diversified, so it is a challenging job to devise an efficient and robust algorithm for the automatic detection of skin disease and its severity. Skin tone and skin colour play an important role in skin disease detection. The colour and coarseness of skin are visually different. Automatic processing of such images for skin analysis requires a quantitative discriminator to differentiate the diseases.

1.2 Purpose

To overcome the above problem, we are building an AI-based model that is used for the prevention and early detection of erythema. Basically, skin disease diagnosis depends on different characteristics like colour, shape, texture, etc. Here, the user can capture images of their skin, which are then sent to the trained model, where the information is processed using image processing techniques and then extracted for machine interpretation. The pixels in the image can be manipulated to achieve any desired density and contrast. Finally, the model generates a result and determines whether or not the person has skin disease. Image processing technologies significantly reduce the time spent on a specific activity by the customer. Hence, it is a time- and money-saving process.

2.LITRATURE SURVEY

2.1 Existing Problem

The Yolo v3 detector is the primary method for pre-screening skin lesions and detecting erythema. YOLO is an algorithm that detects and recognizes various objects in real-time pictures. Object detection in YOLO is done as a regression problem and provides the class probabilities of the detected images. The YOLO algorithm employs convolutional neural networks (CNN) to detect objects in real-time. The algorithm requires only a single forward propagation through a neural network to detect objects. This means that prediction for the entire image is done in a single algorithm run. The CNN is used to predict various class probabilities and bounding boxes simultaneously. Yolo-V3 boasts good performance over a wide range of input resolutions.

2.3 Problem Statement Definition

To build a model that predicts skin diseases that can be prevented by investigating the infected region. Here, the skin tone and skin colour play an important role in skin disease detection. The person can capture images of their skin, and then the image will be sent to a trained model, which analyses the image and detects whether the person has a skin disease or not.

3.IDEATION & PROPOSED SOLUTION

3.1 Empathy Map Canvas

Empathy Map Canvas: An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviours and attitudes. It is a useful tool to help teams better understand their users. Creating an effective solution requires understanding the true problem and the person who is experiencing it. The exercise of creating the map helps participants consider things from the user's perspective along with his or her goals and challenges.

3.2 Ideation & Brainstorming

Brainstorming provides a free and open environment that encourages everyone within a team to participate in the creative thinking process that leads to problem solving. Prioritizing volume over value, out-of-the-box ideas are welcome and built upon, and all participants are encouraged to collaborate, helping each other develop a rich amount of creative solutions.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

1

Define your problem statement

What problem are you trying to solve? Frame your problem as a How Might We statement. This will be the focus of your brainstorm.

5 minutes

PROBLEM

IDENTIFYING SKIN DISEASES
LIKE PSORIASIS, MELANOMA,
ROSCHEA IN EARLY STAGES
WITHOUT THE INTERVENTION
OF A DOCTOR.

Key rules of brainstorming:
To run an smooth and productive session

Stay in topic.

Defer judgment.

Go for volume.

Encourage wild ideas.

Listen to others.

If possible, be visual.

Step-2: Brainstorm, Idea Listing and Grouping

Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

SUBATHRA

Training dataset on both healthy and affected patients

Maintaining hygiene and personal medication

Classify the algorithm

Reasoning across machines

ARTHUR

Using Image Processing and Machine Learning techniques

Detects skin diseases via blood test

Effective prediction of skin disease by analyzing related

Web application for user interface

SOLVAKUMARI

Early detection and diagnosis

Assessments the severity of the infection

Feature prediction as user uploads the image

Machine processes any signs that symptoms related

VELVIZHIG

Detects with large image on erythema

Accurate classification of the training data

Client to detect the skin disease

Remove noise and clean dataset

Step-3: Idea Prioritization

Group Ideas

Take turns sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

20 minutes

CATEGORY 1 - BASED ON DATA

CATEGORY 2 - BASED ON METHOD

CATEGORY 3 - BASED ON RESULT

Step4:prtoritize

- **Prioritize**

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

10 minutes

3.3 Proposed Solution

To overcome the problems due to Erythema, we are building an AI- model that is used for the early detection and prevention of Erythema by investigating the infected region.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	AI-Based Localization and Classification of Skin Disease with Erythema
2	Idea / Solution description	To overcome the above problem, we are building a model that is used for the prevention and early detection of Erythema.
3	Novelty / Uniqueness	The model analyses the image and detects whether the person is having a skin disease or not, and if detected, gives a detailed description of the disease and treatment suggestions.
4	Social Impact / Customer Satisfaction	Image processing technologies significantly reduce the time spent on a specific activity by the customer. Hence, it is a time and money-saving process.
5	Business Model (Revenue Model)	Medical sectors are using image recognition to improve image analysis for identifying diseases and predicting the possibilities of health problems.

6	Scalability of the Solution	Image processing technology has enabled more efficient and accurate treatment plans.

4.REQUIREMENT ANALYSIS

4.1 Functional Requirements

FR.No.	Functional Requirement (Epic)	Sub Requirement (Story /Sub-Task)
1	User Registration	Registration through Form Registration through Gmail
2	User Confirmation	Confirmation via Email Confirmation via OTP
3	User Profile	Users provides their medical history.
4	User Uploads Images(Input)	Upload Images as jpeg Upload Images as png
5	Output Analysis	Output analysed through trained model
6	Provides Description	Gives the detailed description of the skin disease found

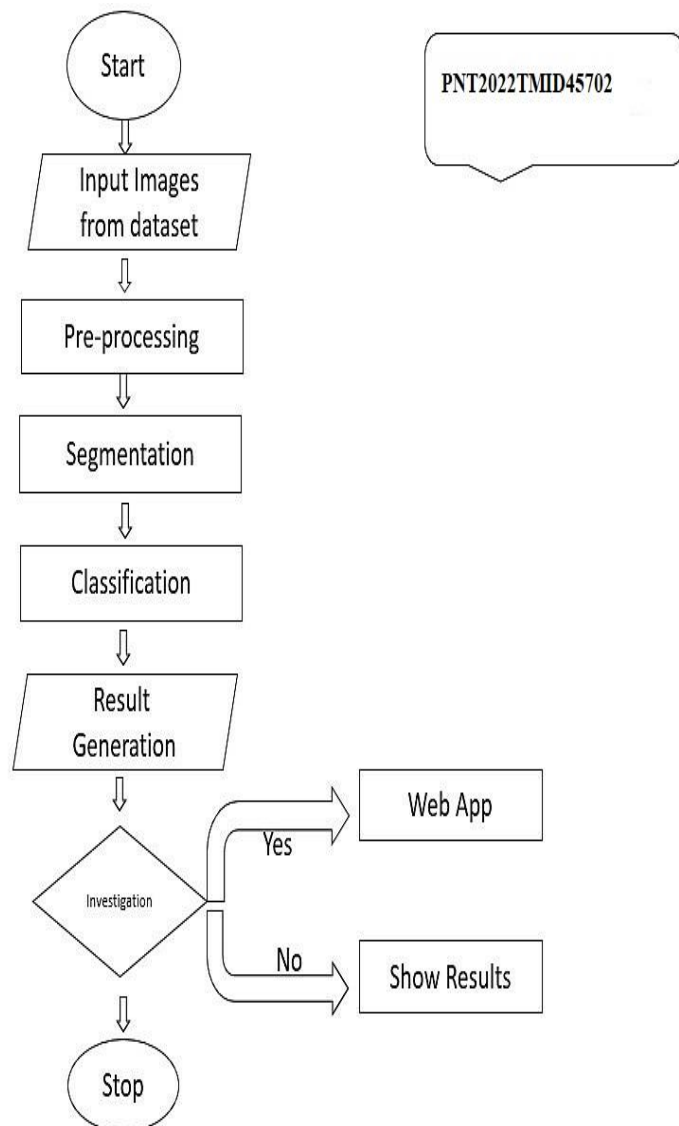

4.2 Non-functional Requirements

NFR No.	Non-Functional Requirement	Description
1	Usability	Used to classify skin disease with erythema
2	Security	It offers greater security and prevents unauthorized individuals from accessing user's data.
3	Reliability	Even with more users, there will be a good performance without failure.
4	Performance	With greater accuracy, the performance is high.
5	Availability	With a good system, all authorized users can access it.
6	Scalability	Performance will be good even with the higher user traffic.

5.PROJECT DESIGN

5.1 Data Flow Diagrams

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

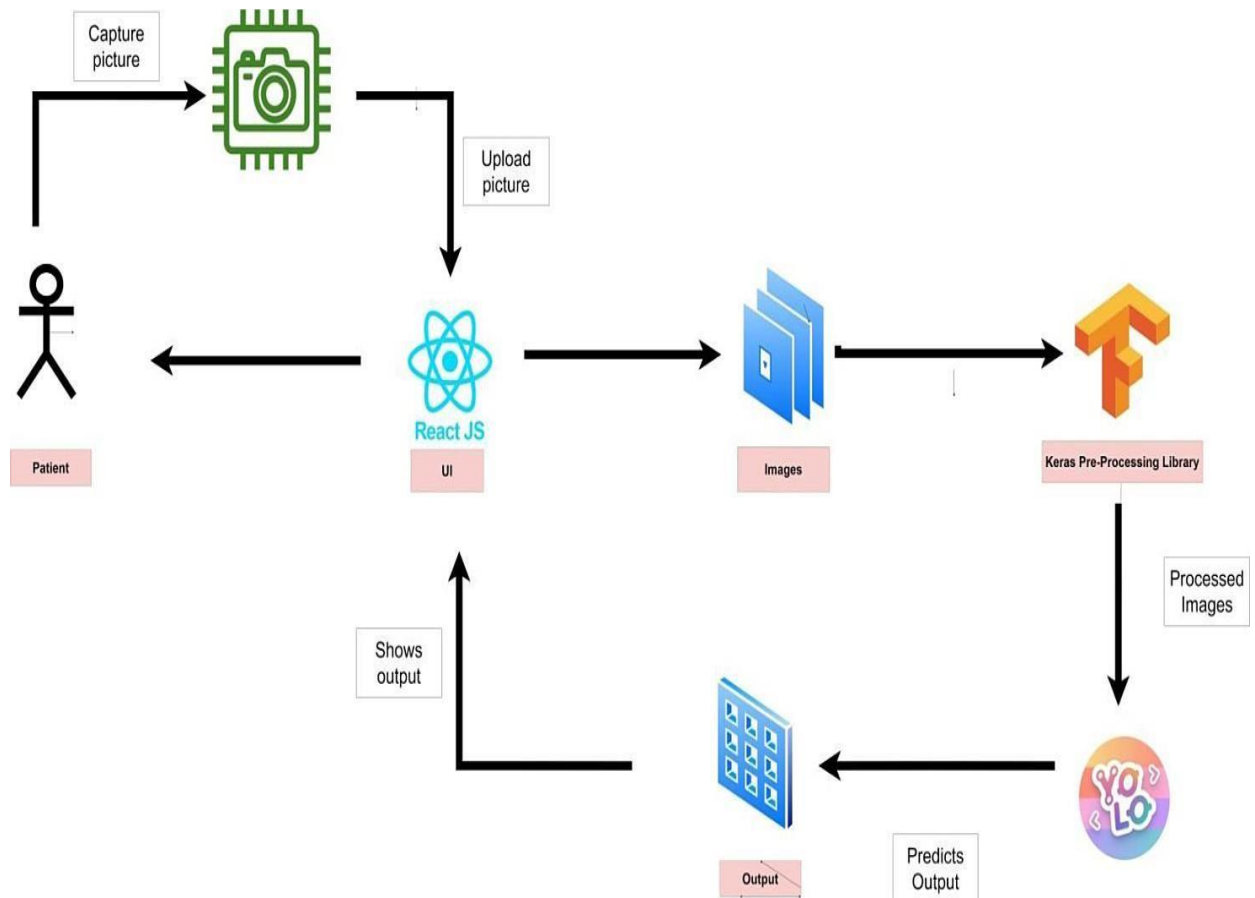

5.2 Solution Architecture

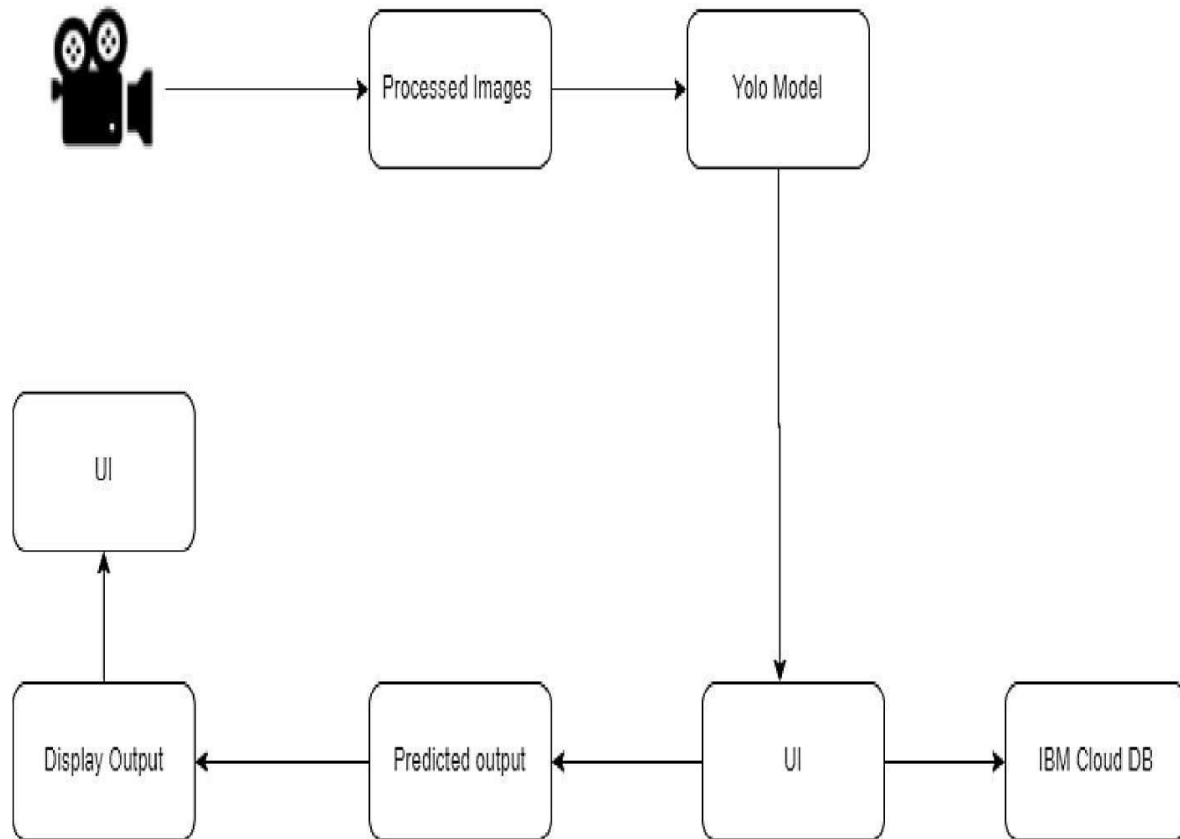

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behaviour, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Solution Architecture Diagram:

Product Backlog, Sprint Schedule, and Estimation:

6.2 Sprint Delivery Schedule

Project Tracker, Velocity & Burndown Chart:

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	20	6 Days	24 Oct 2022	07 Nov 2022	20	04 Nov 2022
Sprint-2	20	6 Days	31 Oct 2022	05 Nov 2022	20	05 Nov 2022
Sprint-3	20	6 Days	07 Nov 2022	12 Nov 2022	20	14 Nov 2022
Sprint-4	20	6 Days	07 Nov 2022	19 Nov 2022	20	19 Nov 2022

Velocity:

Imagine we have a 10-day sprint duration, and the velocity of the team is 20 (points per sprint).

Let's calculate the team's average velocity (AV) per iteration unit (story points per day)

$$AV = \frac{\text{sprint duration}}{\text{velocity}} = \frac{20}{10} = 2$$

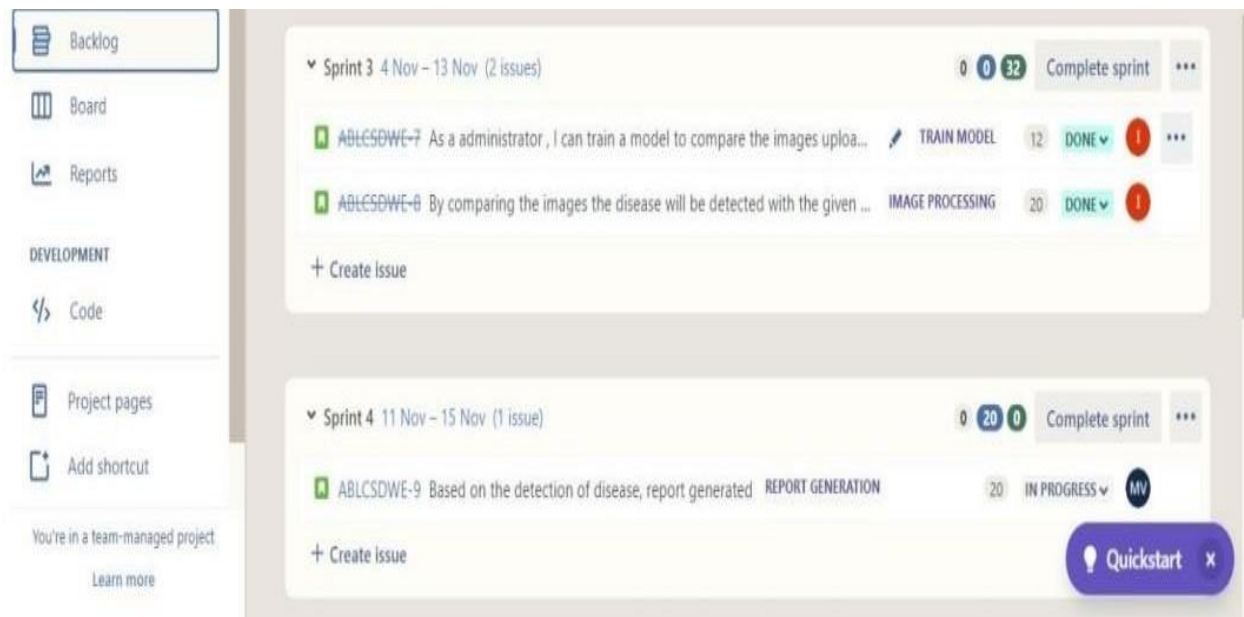

Burndown Chart:

A burn down chart is a graphical representation of work left to do versus time. It is often used in agile software development methodologies such as Scrum. However, burn down charts can be applied to any project containing measurable progress over time.

Quickstart

7.CODING & SOLUTIONING

7.1 Feature 1

Annotate Images Our detector needs some high-quality training examples before it can start learning. The images in our training folder are manually labelled using Microsoft's Visual Object Tagging Tool (VoTT). At least 100 images should be annotated for each category to get respectable results. The VoTT csv formatted annotation data is converted to YOLOv3 format by Convert_to_YOLO_format.py file.

Code:

```
from PIL import Image from is
import path, makedirs import os
import re import
pandas as pd import
sys
import argparse

def get_parent_dir(n=1):
    """ returns the n-the parent directory of the current working
    directory """ current_path = os.path.dirname(os.path.abspath(
    ____file____)) for k in range(n):
        current_path = os.path.dirname(current_path)
    return current_path

sys.path.append(os.path.join(get_parent_dir(1), "Utils")) from
Convert_Format import convert_vott_csv_to_yolo Da
ta_Folder = os.path.join(get_parent_dir(1), "Data")

VoTT_Folder = os.path.join(
    Data_Folder, "Source_Images", "Training_Images", "vott-csv-export"
)
```

```
VoTT_csv = os.path.join(VoTT_Folder, "Annotations-export.csv")
```

```
YOLO_filename = os.path.join(VoTT_Folder, "data_train.txt")
```

```
model_folder = os.path.join(Data_Folder, "Model_Weights")
```

```
classes_filename = os.path.join(model_folder, "data_classes.txt")
```

```
if __name__ == "__main__":
```

```
    # surpress any inhereted default values parser =
```

```
    argparse.ArgumentParser(argument_default=argparse.SUPPRESS) """
```

```
    Command line options
```

```
    """ parser.add_argument( "-
```

```
    -VoTT_Folder", type=str,
```

```
        default=VoTT_Folder,
```

```
        help="Absolute path to the exported files from the image tagging step with VoTT. Default  
        is "
```

```
        + VoTT_Folder,
```

```
    )
```

```
    parser.add_argument( "--VoTT_csv", type=str, default=VoTT_csv,
```

```
    help="Absolute path to the *.csv file exported from VoTT. Default is " +  
    VoTT_csv,
```

```
    )
```

```
    parser.add_argument( "--YOLO_filename", type=str, default=YOLO_filename,
```

```
        help="Absolute path to the file where the annotations in YOLO format should be  
        saved. Default is "
```

```
        + YOLO_filename,
```

```
    )
```

```
    FLAGS = parser.parse_args()
```

```
# Prepare the dataset for YOLO multi_df = pd.read_csv(FLAGS.VoTT_csv) labels =
multi_df["label"].unique() labeldict = dict(zip(labels, range(len(labels))))
multi_df.drop_duplicates(subset=None, keep="first", inplace=True) train_path =
FLAGS.VoTT_Folder convert_vott_csv_to_yolo( multi_df, labeldict, path=train_path,
target_name=FLAGS.YOLO_filename
)
```

```
# Make classes file
```

```
file = open(classes_filename, "w")
```

```
# Sort Dict by Values
```

```
SortedLabelDict = sorted(labeldict.items(), key=lambda x: x[1]) for elem in
```

```
SortedLabelDict:
```

```
    file.write(elem[0] + "\n")
```

```
file.close()
```

7.2 Feature 2

Training Yolo

To prepare for the training process, convert the YOLOv3 model to the Keras format. The YOLOv3 Detector can then be trained by Train_YOLO.py file.

Code:

```
import os import
sys import
argparse import
warnings
```

```
def get_parent_dir(n=1):
```

```
    """ returns the n-th parent directory of the current
    working directory """
```

```
    current_path = os.path.dirname(os.path.abspath(_file____)) for k in
    range(n):
```

```

        current_path = os.path.dirname(current_path) return
current_path

src_path = os.path.join(get_parent_dir(0), "src") sys.path.append(src_path)

utils_path  =  os.path.join(get_parent_dir(1),  "Utils")
sys.path.append(utils_path)

7.3 Database Schema

- Registration: When a new user registers, the backend connects to the IBM Cloudant and stores the user's credentials in the database.
- Login: To check if a user is already registered, the backend connects to Cloudant when they attempt to log in. They are an invalid user if they are not already registered.
- IBM cloudant: Stores the data which is registered.
- app.py: Connects both Frontend and the cloudant for the verification of user credentials

Diagram:

8.TESTING

8.1 Test Case

Test Case No.	Action	Expected Output	Actual Output	Result
1	Register for the website	Stores name, email, and password in Database	Stores name, email, and password in Database	Pass
2	Login to the website	Giving the right credentials, results in a successful login.	Giving the right credentials, results in a successful login.	Pass
3	Detecting the disease	It should predict the disease	It should predict the disease	Pass

8.2 User Acceptance Testing

Section	Total Cases	Not Tested	Fail	Pass
Registration	9	0	0	9
Login	40	0	0	40
Security	2	0	0	2
Disease Detection	10	0	0	10

Exception Reporting	9	0	0	9
Final Report Output	4	0	0	4
Version Control	2	0	0	2

9.RESULTS

9.1 Performance Metrics

S.No.	Parameter	Values
1.	Model Summary	To evaluate object detection models like R-CNN and YOLO, the mean average precision (mAP) is used. The mAP compares the ground-truth bounding box to the detected box and returns a score.
2.	Accuracy	Training Accuracy – 89% Validation Accuracy – 95%
3.	Confidence Score (Only Yolo Projects)	Class Detected – 93% Confidence Score – 90%

10.ADVANTAGES & DISADVANTAGES

Advantages:

- Image processing technology has enabled more efficient and accurate treatment plans.
- It is time and money-saving process.
- Performance of the model will be good even with the higher user traffic.
- In Image processing, the pixels in the image can be manipulated to any desired density and contrast.
- Since high pixel quality is generated, easy classification of skin disease is possible

Disadvantages:

- AI-Models are Susceptible to security risks.
- Inaccuracies are still possible.
- Although AI has come a long way, human surveillance is still essential.

11.CONCLUSION

Even without a large dataset and high-quality images, it is possible to achieve sufficient accuracy rates in this AI model. With accurate segmentation, we gain knowledge of the location of the disease, which is useful in the pre-processing of data used in classification as it allows the YOLO model to focus on the area of interest. Our method provides a solution to classifying multiple diseases with higher quality and a larger quantity of data. With the assistance of our AI-based methods, it saves time and money for patients.

12.FUTURE SCOPE

The future of AI in detecting skin diseases could include tasks that range from simple to complex—everything from answering the phone to medical record review, reading radiology images, making clinical diagnoses and treatment plans, and even talking with patients. AI is already at work, increasing convenience and efficiency, reducing costs and errors, and generally making it easier for more patients to receive the health care they need. While AI is being used in health care, it will become increasingly important for its potential to enhance patient engagement in their own care and streamline patient access to care.
